Cardan joint theory

The PTO drive shaft for agricultural applications consists of two cardan joints and a telescopic coupling. The cardan joint, consisting of two yokes and a cross, is the element used to transmit the motion between two tilted axles. The cardan joint construction is designed so that during rotation, the speed of the output shaft is not always equal to that of the input shaft and this difference in speed depends on the articulation angle of the joint (Fig. 1). The transmission ratio versus the articulation angle and the rotation angle is represented in Fig. 2. The more the ratio deviates from 1 the greater becomes the irregularity of the motion, thus generating undesirable effects (vibrations, noise, inertial stress).

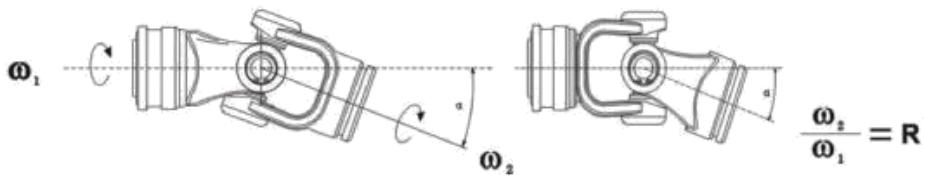

Fig.1

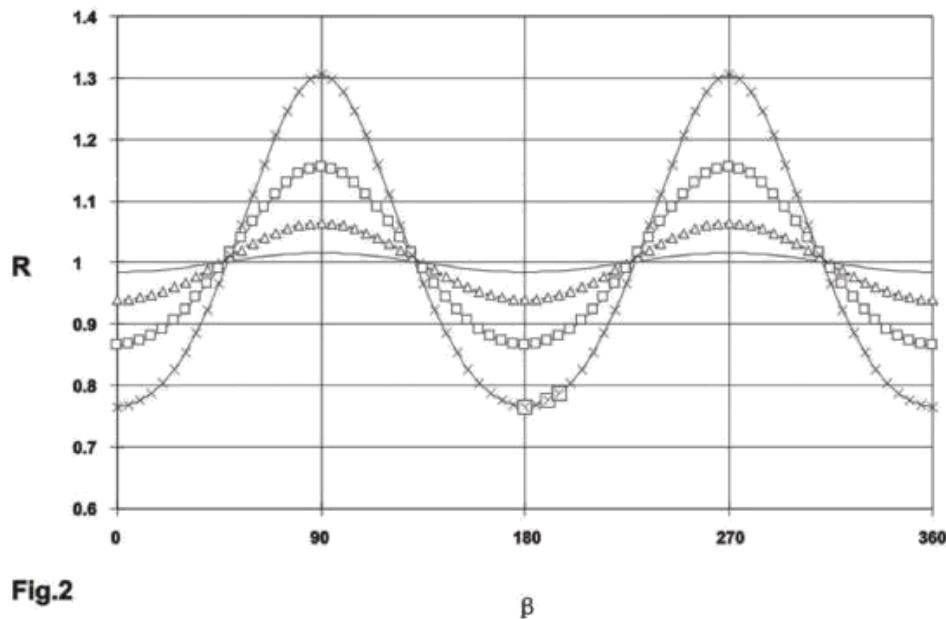

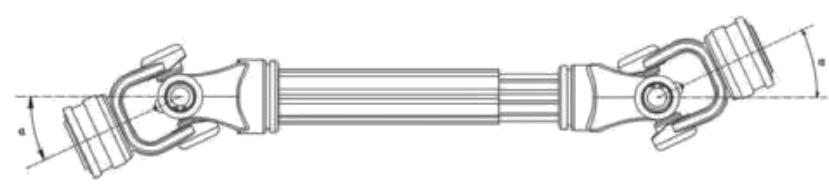

Fig.2

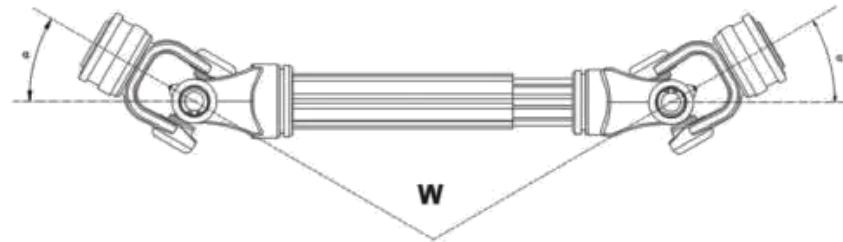

α = articulation angle β = rotation angle

Kinematic characteristics

The standard PTO drive shaft consists of two cardan joints. The irregularities of the single joints thus can be cancelled or mutually combined. When the articulation angles of the two joints are equal (see configuration W or Z in Fig. 3) the transmission is uniform, i.e. The speed of the output yoke is always equal to the speed of the input yoke, thus eliminating the undesirable effects. In all the other angulations (Fig. 4), an irregularity always remains that can be evaluated with the graph on the following page (Fig. 5).

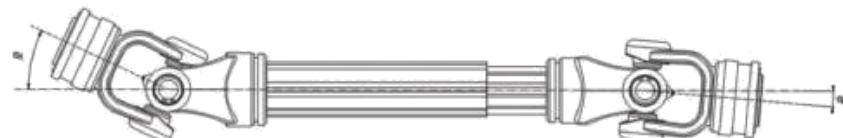

Z

W

Fig.4

PTO Drive shaft rotation irregularity alignment chart

Constant velocity joint CvJ

Irregularity "i" of the motion depends on the articulation of the two cardan joints and on the difference between the articulations of the two joints (see the example: with angular difference being equal, the irregularity is greater if the articulations of the single joints are greater).

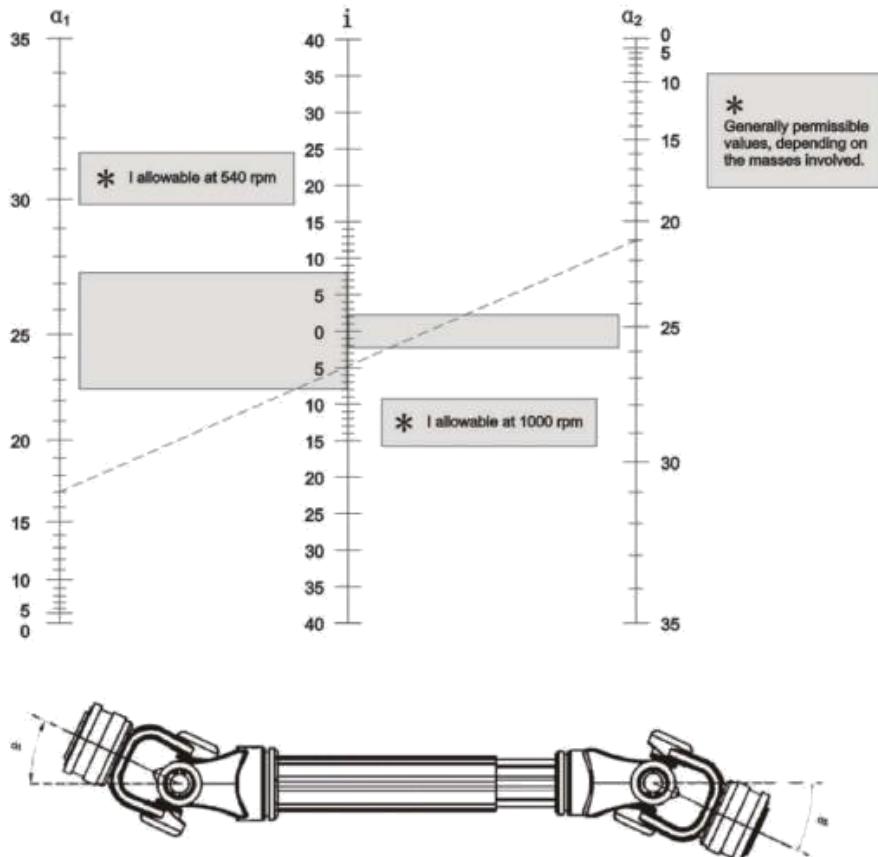

Fig.5

Example:
 $\alpha_1=0^\circ$, $\alpha_2=4^\circ$, $\alpha_1-\alpha_2=4^\circ$
i=0,5%
 $\alpha_1=21^\circ$, $\alpha_2=25^\circ$, $\alpha_1-\alpha_2=4^\circ$
i=6%

The CvJ (Constant Velocity Joint) is a double universal joint with a centering system that equally divides the articulation angle between the two yokes (W configuration). The speed of the output yoke is always equal to the input speed and there are no rotation irregularities. In a PTO drive shaft with a CvJ joint and a standard joint (Fig. 6), the total irregularity is caused only by the standard joint, that therefore must work with small articulation angles. For high work angles at the two ends of the shaft, two CvJ joints must be used (Fig. 7). The CvJ joint can work with high articulation angles only for brief periods (ex.: while steering). Absolute quality And reliability of the CvJ construction are ensured by the ball bridge welded to the yoke which considerably reduces stress and consequently wears in the ball-cylinder contact zone and in the splined coupling between the shaft and the yoke.

NOTE: available on demand with interfering clamp bolt
The torque limiter interrupts the power transmission when the torque exceeds the setting value,
by shearing the bolt. Transmission is restored by inserting a new bolt in the device.

The torque limiter is activated when the operating torque exceeds the setting value. During the limiting phase, the device transmits reduced power in pulses. The elimination of the external cause and the reduction of the PTO speed allows the normal power transmission to be re-established. When the limiter is activated, it is recommended to disconnect the PTO to avoid unnecessary wear and overheating.

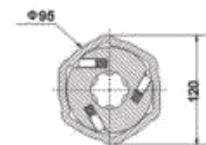

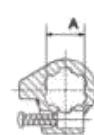

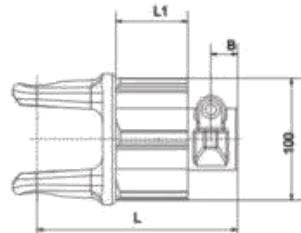

Type *: Spline manufacture is divided into two 13/8"-Z6, 13/8"-Z21. For example: SA10138S1, SA10121S1

NOTE: available upon request for anti-clockwise direction of rotation.

The device is used to transmit the motion in a single rotation direction, when the tractor drives the implement. During the stopping phase, with the tractor PTO disengaged and the implement still moving, the transmission is disconnected. This device is useful for operating machinery with high rotation inertia because during the stopping phase, the tractor PTO is dis-engaged from the driven machine.

The torque limiter is activated when the setting torque exceeds the calibration torque. During the torque peak limiting phase, the clutch continues to transmit power. The clutch is useful as a safety device to protect against load peaks and to start machines with high rotational inertia. It is recommended to ensure that the setting value is correct to avoid excessive heating of the friction discs (insufficient setting) or clutch seizing (excessive setting).

Friction clutches may become hot during use.

Do not touch!

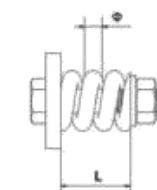

Keep the area around the friction clutch clear of any material which could catch fire and avoid prolonged slipping.

The torque limiter is activated when the setting torque exceeds the calibration torque. During the torque peak limiting phase, the clutch continues to transmit power. The clutch is useful as a safety device to protect against load peaks and to start machines with high rotational inertia. It is recommended to ensure that the setting value is correct to avoid excessive heating of the friction discs (insufficient setting) or clutch seizing (excessive setting).

Friction clutches may become hot during use.

Do not touch!

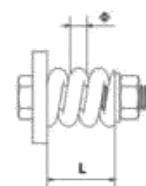

Keep the area around the friction clutch clear of any material which could catch fire and avoid prolonged slipping.

Safety and working conditions

Safety and working conditions

EQUIPPED WITH:

Safety labels
Instruction handbook
Anti-rotation chains

Label on outer protective tube

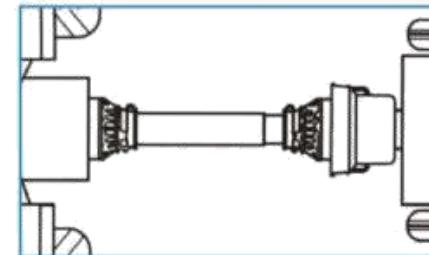

Label on outer steel tube

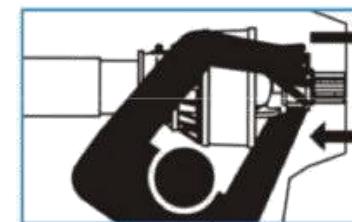

“Use and Maintenance” handbook

Please read carefully before use “Use and Maintenance” handbook.
Before starting to work, make sure that:

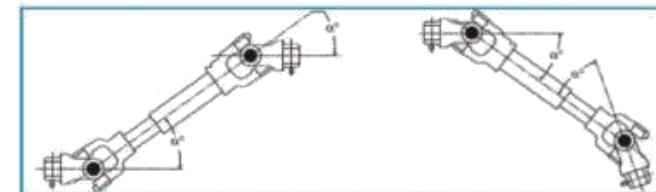

- Ensure that all driveline, tractor and implement shields are functional and in place before operation . Damaged or missing parts must be replaced with original spare parts, correctly installed, before using the driveline.

- Ensure that the driveline is securely attached to the tractor.

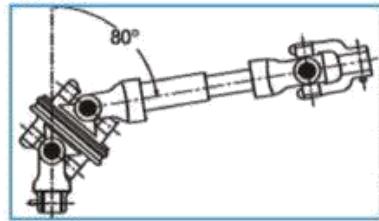

- the drive shaft does not exceed the speed and power conditions defined in the machine’s operating handbook. Any safety device must be engaged on the machine side. All rotating parts must be protected.

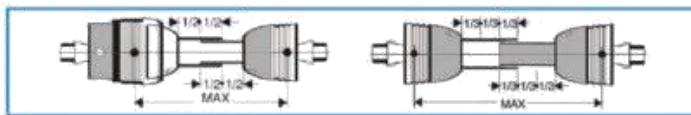

- Working angle not allowed

Safety and working conditions

safety and working conditions

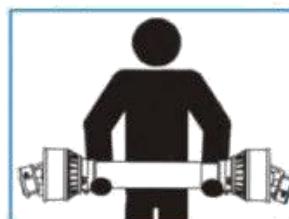

- the PTO drive shaft joint does not operate continuously with an angle close to 80°, but only for brief periods (steering).

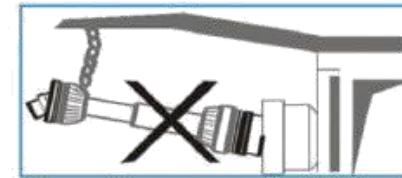

- Do not exceed the maximum elongation conditions while working.

- DANGER!** Rotating driveline-contact can cause death. Keep away! Do not wear loose clothing, jewelry, or hair that could become entangled with the driveline.

- The transmission must be transported horizontally to prevent accidents (since it may slip out) or to avoid damage to safety guards. Depending on the weight, use a suitable means of transport.

- Never use the safety chains to support the driveline for storage. Always use the support on the implement.

- Do not stand on the driveline. Do not step over, or go under the driveline.

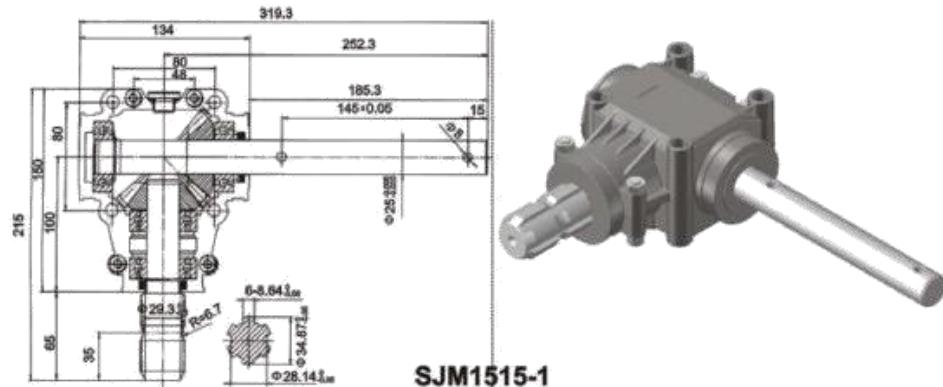

- Disengage the P.T.O., turn off the tractor engine and remove key before approaching the implement or performing maintenance work.

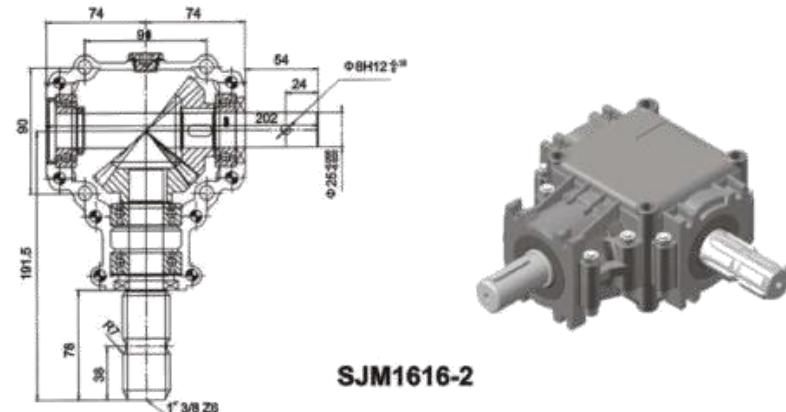

- Friction clutches may become hot during use. Do not touch! Keep the area around the friction clutch clear of any material which could catch fire and avoid prolonged slipping.

SJM2509-2F.W

Item No		SJM2509-2F.W
Ratio		1:2.78
Module		3.8
Input Description		Spline shaft
Output Description		Plain shaft
Housing Material		YL104
Gear Material		20CrMnTi
Shaft Material		40Cr/20CrMnTi
Housing Surface Colour		True colors
N.W	kg	7.36
Rated input power	HP	14
	KW	10
Rated output torque	N.m	4.9
Rated Input speed	rpm	540

Gear box

SJM2312-1

Item No	SJM2312-1	
Ratio	1:1.92	
Module	5	
Input Description	Spline shaft	
Output Description	Cone base aequilat spline shaft	
Housing Material	QT400-18	
Gear Material	20CrMnTi	
Shaft Material	20CrMnTi	
Housing Surface Colour	According to the customers' requirements	
N.W	kg	16
Rated input power	HP	30
	KW	22
Rated output torque	N.m	20
Rated input speed	rpm	540
